What is the goal of the application?
The goal of the application is to help locate lost objects.

What are the rules in which the application operates?
The user has to register and create a user ID, then login. They will input the details of the objects, and when out of range an alarm will trigger.

What will the challenges that you will face?
The RFID simulation will probably be the challenge.

Is it clear that the user will know what to do when they get the application?
Yes

What are the constrains that you feel the user will have when they use your application?
There is a restriction on how many objects that can be input into the database.
